ASTRONOMICAL CHARACTERS.

Names and Characters of the Planets.

- ⊕ *The Sun*, which is not properly a Planet, but of the nature of a fixed Star, is the source and centre of light and heat to the whole Solar System.
- ♀ *Mercury*, which moves round the Sun in 87 days, and is the nearest Planet to it, emits a very bright white light : he appears a little after sunset, and again a little before sunrise.
- ♀ *Venus*, which moves round the Sun in about 225 days, is the most beautiful Star in the Heavens. She is never seen in the eastern quarter of the Heavens when the Sun is in the western ; but always seems to attend him in the evening, or to give notice of his approach in the morning. This Planet will be the Morning Star from January 1st, to May 28th. From that time she will be the Evening Star until the end of the year.
- ⊕ *The Earth*, not usually reckoned among the Planets, though it is one, moving round the Sun in 365 days.
- *The Moon*, moving round the Earth, in about 28 days, and going with it round the Sun.
- ♂ *Mars*, next above the Earth, moves round the Sun in 687 days, it is of a red fiery colour, and always gives a much duller light than Venus, though sometimes he equals her in size,
- ♀ *Jupiter*, next above Mars, moves round the Sun in about twelve years ; the largest of all the Planets, and is attended with four moons.
- ♃ *Saturn*, next above Jupiter, and near as large, attended with seven moons, most of them larger than the Earth, moves round the Sun in about 90 years. Jupiter and Saturn likewise often appear at great distances from the Sun. The former shines with a bright white light, and the latter with a pale faint one : and the motion of Saturn among the fixed Stars is so slow, that, unless carefully observed, he will not be thought to move at all.
- ♄ *Herschell*. This planet was not discovered till March 13, 1781 ; it was attended with several moons, is eighty times larger than the Earth, and does not complete a revolution in a less time than eighty-two years.
